

## Peer Review

For my peer review I read William Alizio's paper on large scale simulations and dark matter in the universe. Overall I thought the paper was very well written, with only a few mistakes in the paper, which I will get to later. The structure of the essay was very clear, first giving introductions to both papers and then talking about how they relate. The topics discussed were kept to a reasonable length, giving me an overall understanding of the topics of both papers, while still keeping it short enough to keep my interest. Also, it can be seen that a lot of thought was put into the topics, since there is a lot of personal feedback throughout the review. I also like that William doesn't pretend to completely understand the topics and admits it in his paper, but still shares what he did learn. The few mistakes I found were only in the last sentence, where "given" should be changed to "giving" and "inconsistency's" should be changed to "inconsistencies". Apart from those small mistakes though, I found the paper to be educational and an enjoyable read.
